

Phase Four

Start Up Filtration Equipment

After the pool is full, we will return, install your automatic cleaner, and start up your pool pump and filtration system. We will inspect the system for proper operation and be sure everything is performing at its best.

Chemical Additions & Balance

We will perform a chemical check of your pool and add the start-up chemicals to your water. Other factors, such as pH will be adjusted.

It is important that you bring a complete sample of water into our water lab at any of our stores within a week of your pool's start up. This allows us to "fine tune" your water for the maximum clarity, sanitation and comfort.

Final Electrical & Plumbing Inspections

We will arrange for final inspections by your local building officials. You may need to be home for this inspection. With their approval, you can now JUMP IN and begin to enjoy your pool.

Final Clean Up

A crew will return to do any necessary final clean up, leaving your backyard ready for the landscaping.

Install Coping-to-Deck Expansion Joint Caulking

A special caulking material is applied in the space between the coping and the deck. This material allows for expansion due to moisture and extreme temperatures. To apply the caulking, the area around the pool must remain dry with no threat of rain. Curing time is 24 hours. Not applicable to stone coping.

Instruction Session for Pool Care & Operation

A member of our experienced service staff will meet with you and give you a Pool Owner's Manual, as well as personal instructions on how to care for and operate your pool. We will also provide you with important safety and warranty information. Ask when our next POOL CARE MADE EASY seminar will be held. These seminars are PERFECT for the new pool owner and will enlighten you and provide important tips on pool care. Be prepared to ask questions. We want you to have as much knowledge as possible. The more YOU know, the easier it is for you to care for your pool.
